THE PUSH PULL LEGS ROUTINE

This push pull legs routine consists of 6 training days per week. The push workout featured in this PDF can be used for one of your “push” days during the week and will focus on targeting your upper body pushing muscles (chest, shoulders, and triceps). The “pull” and “legs” workouts will be provided in separate PDFs.

[Monday – Push Workout](#)

[Tuesday – Pull Workout](#)

[Wednesday – Legs Workout](#)

Thursday – Rest

[Friday – Push Workout](#)

[Saturday – Pull Workout](#)

[Sunday – Legs Workout](#)

Monday – Rest

[Tuesday - Repeat](#)

The exact days don’t matter for your workouts, but the key is to get at least one rest day in between each consecutive 3 workouts. Abs and calves exercises can be thrown into the main workouts as well, or performed on rest days.

THE PUSH WORKOUT

Exercise	Sets	Reps	Rest (min)
Incline Barbell Bench Press	3-4	6-8	2-3
Standing Dumbbell Shoulder Press	3-4	10-15	2-3
Paused Flat Dumbbell Press	3-4	8-12	2-3
Lean-Away Dumbbell Lateral Raise	2-3 per arm	10-15	1 min rest between arms
Seated Decline Cable Flies W/ Supination	2-3	10-15	1.5-2
Incline Dumbbell Overhead Extensions	2-3	10-15	1.5-2

**Beginner/novice lifters should stay on the lower end of the volume requirements whereas more experienced lifters can opt for the higher recommendation of sets for some/all of the exercises.*

PUSH WORKOUT EXERCISE TUTORIALS

EXERCISE 1: INCLINE BARBELL BENCH PRESS

Step 1 (Bench Angle): Setup an incline bench so that it's at roughly a 30-degree angle (generally two notches up from the bottom). But I would suggest trying out various angles to see which best activates your upper chest. For shoulder-dominant pressers, you might even find that a very low incline of 15-degree angle (one notch up) activates your chest better. Stick your chest up, retract your shoulder-blades, then unrack the bar.

Step 2 (Descend): Lower the bar to your upper chest region while slightly tucking your elbows and keeping your forearms vertical and directly under your wrists. Make sure to use full range of motion such that the bar physically touches your chest at the bottom. If you experience shoulder pain at this point however, then you can stop the rep earlier.

Step 3 (Press): Press back up to the starting position while keeping your shoulder-blades remain retracted and tight and your chest up and out. Keep your elbows slightly tucked as you press, and press up until your arms lockout.

PUSH WORKOUT EXERCISE TUTORIALS

EXERCISE 2: STANDING DUMBBELL SHOULDER PRESS

Step 1 (Setup): Standing with your feet shoulder width apart, take a dumbbell in each hand. Raise the dumbbells to head height, with the elbows tucked very slightly forward rather than completely flared out to the sides. This will be your starting position.

Step 2 (Press): Extend through the elbows to raise the weight overhead. As you do so, contract your abs and your glutes and keep them contracted throughout the press. This will prevent your lower back from arching as you press. Avoid using momentum or leg drive to help you lift the weight up. At the top position, your arms, head, hips, and feet should form one straight line.

Step 3 (Descend): Slowly lower the weight back to the starting position with the dumbbells roughly at the level of your head before pressing up again for another rep

PUSH WORKOUT EXERCISE TUTORIALS

EXERCISE 3: FLAT DUMBBELL PRESS

Step 1 (Set Up): Using your thighs to push the dumbbells up, kick up one dumbbell at a time so that you can get them into the starting position. Stick your chest up towards the ceiling and pinch your shoulder blades together as if you were squeezing a pencil between them. This will create some space between your back and the bench. You need to actively maintain this position throughout the lift.

Step 2 (Press): Press up by thinking about “squeezing your biceps together” to better activate your chest. Ensure your shoulder-blades remain retracted and tight. Keep your elbows slightly tucked as you press, and press up until the dumbbells almost touch.

Step 3 (Descent): Slowly lower the weight until the end of the dumbbells just about touch your chest. At the bottom position, your hands should be directly above your elbows. Make sure your shoulderblades are retracted and tight before performing another rep.

WANT TO SHORTCUT YOUR TRANSFORMATION?

If you want to build muscle as fast as possible with this routine, then you need to pair it with a nutrition plan that helps your muscles grow and recover to the best of their ability after each workout.

Because what's more important than the hour you put into the gym everyday is **how and what you use to then fuel your muscles** for growth during your several other waking hours of the day.

That's exactly how thousands Built With Science members just like Michael here are able to drastically transform their physiques in such a short amount of time:

To get started today with an all-in-one science-based program that takes care of your training AND nutrition for you, by showing you exactly what to eat and when in order to build muscle and lean down as efficiently possible, then simply take the quiz below to find out which program is best for where you're at right now:

PUSH WORKOUT EXERCISE TUTORIALS

EXERCISE 4: DUMBBELL LATERAL RAISES

Step 1 (Set Up): Grab a dumbbell in one hand and with your other arm hold onto a fixture such that you can use it to lean-away slightly from it as you perform the movement.

Step 2 (Pull): Raise the dumbbell out to your side in the scapular plane (which isn't directly out to your side, but slightly forward) until it reaches about shoulder-height. Your arms should be just slightly bent at the elbow as you raise. And as you raise, think about raising the weight “out” as much as possible opposed to thinking about raising the weight “up”. Avoid using excessive momentum to swing the weight up.

Step 3 (Descent): Control the weight back down to the starting position and repeat for the desired number of repetitions.

EXERCISE TUTORIALS

EXERCISE 5: SEATED DECLINE CABLE FLIES W/ SUPINATION

Step 1 (Set Up): Setup a high inclined bench in between a cable system. Move the handles up such that they are above the level of your shoulders when you're seated. Grab the handles, retract your shoulder blades, and stick your chest up to prepare for your first rep.

Step 2 (Fly): Perform a high to low fly motion by bringing the cables down and in. As you do so, supinate your wrists by rotating your palms upwards towards the end of each rep and focus on driving your elbows in as if you were trying to touch them together at the end of each rep. Your shoulder blades should remain retracted back as you perform the fly and your chest should remain up and out. Your arms should also remain just slightly bent during each rep. At the end position, avoid "caving in" by letting your shoulders round forward especially at the end position. You should feel a strong contraction in the lower/outer part of your chest when executed properly.

Step 3 (Return): Control the cables back to the starting position and repeat for another rep. Your arms should be slightly bent throughout each rep.

EXERCISE TUTORIALS

EXERCISE 6: INCLINE DUMBBELL OVERHEAD EXTENSIONS

Step 1: Set up an incline bench to around 30 degrees. Lay your back on the bench with the dumbbells overhead and parallel with the angle of your upper body.

Step 2: While keeping your elbows locked, lower the dumbbells back behind your body as far as it will go.

Step 3: Press the weight back up to the starting position by using your triceps to lock out your arms while keeping your elbow locked in position. Repeat.

ADDITIONAL COMMENTS

I hope this PDF is useful for you! I put in a lot of effort into providing this routine for you free of charge. All I ask in return is that you show your support for my work and connecting with me on my social media platforms where I share more informative content on a regular basis:
